Q. 20	In cross-validation, we run our modeling process on different subsets of the data to get multiple measures of model quality. In k-fold cross-validation, the original dataset is equally divided into k subparts or folds. Out of the k-folds, for each iteration, one group is selected as test data, and the remaining (k-1) groups are selected as training data. This process is repeated for k times. The final accuracy of the model is calculated by taking the mean accuracy. When the dataset is smaller, cross-validation procedure should be selected for higher accuracy.	CBSE Study Material	1	20	4
Q. 21	 (a) The steps involved in telling an effective datastory are given below: Understanding the audience Choosing the right data and visualisations Drawing attention to key information Developing a narrative Engaging your audience (b) Option A is a better data story. Reasons 1. The insight given at the bottom of the visual is giving a clear idea about context which is not therein Option B. Option A visual provides a compellingnarrative. 	CBSE Study Material	3	35	4
